Anchor Software's MarketGenius (TM) Suite is a collection of direct marketing application modules. The suite includes the Addressforward (TM), AddressVerifier (TM), MaxDup+ (TM), MaxConvert+ (TM), MaxCoder (TM), ZIP+4 Online, **Database** Insight, and **Database** Wizard components. MarketGenius's Addressforward module **links** to the U.S. Postal Service's FASTForward (TM) system. FASTForward offers change of address (COA) **features** that streamline mailing list updates. Addressforward includes automated job queue **features** that improve throughput. The AddressVerifier module offers real-time updating and verification of address information. It can be embedded in Internet, online call center, point-of-sale (POS), or batch processing applications. MarketGenius's MaxDup+ eliminates **duplicate** records. It includes consumer and business **merge** and purge **features**. The MaxConvert+ component converts multiple file layouts to standardized formats. Reporting **features** allow users to review jobs and address quality control requirements. MaxCoder is an address program that references the U.S. Postal Service's Coding Accuracy Support System (CASS) certification standards. MarketGenius's ZIP+4 Online component analyzes addresses and assigns appropriate U.S.P.S.-certified information. **Database** Insight, a **database** analysis tool, can create reports and graphs and integrate with Microsoft Excel and other spreadsheet applications. The program can evaluate information across multiple time periods. MarketGenius's **Database** Wizard creates, consolidates, and updates **databases**, employing Anchor Software's Image Crusher (TM) technology to eliminate **duplicates**. The module lets users define update actions and key **relationships**. Finished tables can be referenced by any SQL query engine, providing users with ad hoc reporting **features**.

Verity's Verity (R) K2 Enterprise automatically captures information from intranets, portals, and **databases**, as well as from content management, enterprise resource planning (ERP), customer resource management (CRM), and other applications. It also collects information from partners and customers. Its modular architecture can scale to meet increasing user and data processing demands. The product works with existing security systems. Verity K2 Enterprise includes full-text search, query error correction, stemming expansion, query-by-example, and automated summarization **features**. Its **Relational** Taxonomy technology provides multiple paths to information. Parametric selection **features** support the searching and access of structured and unstructured text. Verity K2 Enterprise removes **duplicates** from results lists. It also **organizes** results by relevance or category. The system can import existing taxonomies. Its Thematic Mapping **feature** automatically extracts concepts from information. Verity K2 Enterprise also includes automatic classification and information recommendation **features**. The system identifies **organization** experts. It supports over 70 languages.

REVIEW TYPE: Product Analysis  
GRADE: Product Analysis, No Rating

Geonomics' iSITE 4.7 (a combined software and data product and **add - in** to Maptitude desktop geographical information system GIS) and Experian's Mosaic, Profiler 2.5, and Global Mosaic are described lifestyle segmentation profile (LSP) geospatial software components. LSPs are used by business geographic practitioners who establish preferred site location profiles for multibranch retail facilities. LSPs are generally created by **merging** many data **fields** provided in a census **database** and in proprietary private **databases**, including those provided by credit

reporting bureaus and the in intercensus-year data update. Experian compiles such data and has been creating LSP **databases** for over 20 years and for more than a dozen countries. Mosaic's LSPs are similar but not exacting the **same** as CACI's ACORN LSP. Mosaic's LSPs were derived from 1990 census data combined with INSOURCE, which was jointly created in 1996 by Experian and Metromail. Mosaic was created by integrating information **linked** to phone numbers, **property** data, and direct consumer responses, as well as other geographic- **specific** data. Iterative cluster analysis was used to establish a dozen major core group and 62 subgroup classifications. Profiler 2.56 generates reports, and Global Mosaic may be the first global LSP **database**. Global Mosaic classifies almost a billion consumers globally into a single universally defined lifestyle segmentation system. Global Mosaic's data assumes that all cities are alike and that their **common** characteristics can be pinpointed and replicated.

**PRODUCT NAME: Legacy 5.0 Standard & Deluxe (694096)**

Millennia Corp (642851)

PO Box 66

El Mirage, AZ 85335 United States

TELEPHONE: (623) 875-4928

RECORD TYPE: Directory

CONTACT: Sales Department

Legacy 5.0 from Millennia is a family history program and family tree maker. It produces all of the standard genealogical reports and is capable of storing large amounts of family-related information. Legacy tracks notes, sources, pictures, alternate names, dates, events, and sounds. It can import and **merge** files from other **family** tree applications, while removing **duplicate** entries. Pictures can be imported in most **common** picture formats. Other entry features include quick-fill forms; blank reports and forms for data gathering; support for multiple sets of parents per individual and entry of 60 children per parent; and a date calculator, which speeds calculation of birthdates, death dates, and ages. Legacy produces a wide range of output, such as a calendar report, LDS Ordinance Report, research log, surname summary, timelines, pedigree charts, descendant reports, and family group sheets. Genealogists can also export their work to other applications, including TempleReady and Ancestral File. The system can even produce a family album, complete with pictures. Newer features of Legacy Deluxe include a geolocation **database**, color scheme choices, a to do clipboard, a U.S. county verifier, reports in several languages, and a calendar creator. Users can extend Legacy with add-ons such as GENMatcher, a genealogy-file comparison utility, Legacy Charting Companion, and Palm OS software.

REVIEW TYPE: Product Analysis  
GRADE: Product Analysis, No Rating

**Data mining** tools allow marketers, statisticians, and IT professionals to **sort** through **data** and to cull new information that cannot usually be found without the assistance of **data mining**. **Data mining** can actually make **information** from data and can also show otherwise undetected trends and **associations** among **data**. Among tasks for which **data mining** can be used effectively are evaluation of customer **databases**, determination of demographic groups, and prediction of pricing required to attract or keep customers for an item or product line. For instance, a credit card company can use **data mining** to hone in on card-holders who have high credit risks by using a model that evaluates variables, including credit limit, balance, age, and income. To make the most of **data mining** tools, considerable up-front investments of time and effort are required. The organization must first ascertain the precise question to be answered, use a suitable and effective model for access to and analysis of data, and deploy qualified workers experienced in statistical or data analysis to interpret results accurately. Software tools work well, but experts with good data analysis skills are required. Predictive and descriptive **data mining** models are available. Other components in the **data mining** toolset are visualization tools and interfaces to **databases**.

Object-oriented **databases** are capable of doing so much more than relational **databases** when handling complex data relationships, but companies must find very experienced managers and developers to harness the power and features provided. Relational **databases**, which **organize data** into columns, tables, and rows, are good for handling hard-wired data relationships between information sources, but object-oriented solutions are needed to manage when set-in-stone data relationships change often. Object-oriented systems allow data chunks to inherit any on-the-fly changes made to a **database**, thus allowing tracking of parts of products to be handled more efficiently and quickly. Normally **associated** with video storage and derivatives trading businesses, **object-oriented databases** are now being used more and more for more traditional services that require complex data relationships.
